## Introduction

Falls pose a major problem in the inpatient settin and remains a prominent source of injury, morbid and mortality, especially among oncology patien

- Oncology patients have a unique set of risk factors
- Various methods to fall prevention exist
- Despite current methods, nearly 1 million falls occur in the inpatient setting per year

# **Background and Significance**

Falls in the inpatient setting are possibly prevent and can lead to poor health outcomes.

- 23% to 42% resulted in injuries
- 2% to 9% of injuries resulted in serious consequences

Centers for Medicare and Medicaid Services (CI implemented a no-pay policy preventing

- One patient fall is nearly \$14,000
- Inpatient stays can increase up to 6 days

Studies show programs to prevent falls should include staff and patients, however, they lack vita components:

- Display inconsistency with communication and engagement
- Not patient-centered
- Do not account for unique risk factors

Two oncology units and a bone marrow transplar unit at an academic medical center have patients who experience high numbers of falls.

- Cancer itself is a risk factor for falls
- Unique risk factors such as fatigue, pain, and neuropathy

# Engaging patients and caregivers in their safety through the use of a visual cue to decrease patient falls: A pilot study

Nisha Lund, BSN, RN, OCN

DNP Chair: Jeffrey Kwong, DNP, MPH, AGPCNP-BC, FAANP, FAAN

# **Objective**

ing idity, nts.	<ul> <li>To continue the pilot study on oncology-b</li> <li>Use a visual cue as a reminder</li> <li>Patient engagement through a patient-</li> </ul>	
	Methodology	_
S	To evaluate the effectiveness of a bedside visual cue for fall prevention on cology-based units:	
ntable	<ul> <li>Total of 62 beds</li> <li>2 oncology units and a bone marrow transplant units</li> <li>Sign in patient's visual range</li> <li>Black and white, large font, call bell</li> <li>Data collection tool for falls</li> </ul>	
SMS)	<ul> <li>compliance and use of sign.</li> <li>Audits performed weekly on random days</li> </ul>	
	Performed in two phases:	
	1. Educational Phase: 3 weeks	
tal	<b>2. Implementation Phase:</b> 12 weeks with visual cue at patient's bedside with data outcome collection

### DNP Team Member: Mary Beth Russell, PhD, MA, RN-BC

### ased units:

### centered approach

Please use the call bell and wait for assistance when you want to get up.

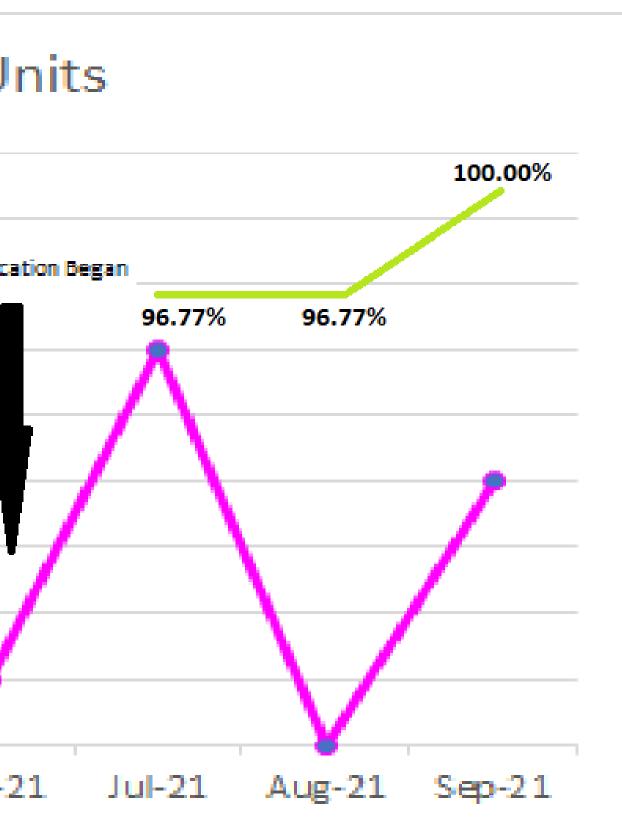

### Do not get out of bed until help comes.

Utilice el timbre de llamada y espere a que le ayuden cuando quiera levantarse.

No se levante de la cama hasta que llegue la ayuda.

#### **Compliance Outcomes:**

- 1,488 Audits in total
- 99.28% overall compliance with signs

#### **Falls Outcomes:**

- Pre-Implementation: 3 Months: Apr Jun 2021: 13 Falls, 5 Injuries
- Post Implementation: 3 Months: Jul Sept, 2021: 10 Falls, 0 Injuries
- Decreased Falls, 23.97%, not statistically significant (p=0.473)
- Decreased Injuries: Statistically Significant (p = 0.025)

Increased engagement of fall prevention:

- Patients and care-givers aware of sign Staff aware of high-risk patients and utilized sign

- Sign blended into background
- Non-Compliance evaluation revealed recommendations: • One sign was missing • Sign to be in bright yellow

outcomes:

Feasible method to increase engagement and collaboration between staff and patients

#### Outcomes

- **Discussion and Implications**

Further evaluation for a visual cue can possibly enhance

• Change the sign to yellow color, add languages • Implement over multiple units for longer duration • Cost for utilization is low at \$1.78 per sign • Use in a variety of settings of risk reduction

#### Conclusion

Cost effective, practical, reliable, high compliance Heightened awareness surrounding fall risk Increase patient safety and satisfaction
